Target version:			
Resolution:			
Description			
All plpgsql functions will need two new arguments, and one removed argument:			
start DATE, end DATE, and removal of offset INT.			
The functions will be altered in the following ways:			
<ul style="list-style-type: none">• Determining the length of the WHILE loop from the date ranges, if present, instead of using the interval to calculate it.• Alter the queries to use the start DATE parameter to position the start of the set, and then utilize the WHILE loop to offset from that point, ie, WHERE date = date_start + (interval * iterations)::interval
