Description

Today it uses the functions "SPI_ *" to perform query on database. It would be interesting if there was an object with methods to this question, style "PDO".

For example:

```
// of "SELECT PG_get_exp('x','y','z')" to
$fnResult = PG::fn->pg_get_exp('x','y','z')

$status = PG::status()
$chages = PG::exec()

$res = PG::query()
$res->count()
$res->next()
$res->rewind()

$item = $res->fetchRow()
$item = $res->fetchObject()
$item = $res->fetchArray()

or

while(($item = $res->fetchObject('ns\Class'))!=null)
```
